## The Monochord in Ancient Greek Harmonic Science

Among the many instruments devised by students of mathematical sciences in ancient Greece, the monochord provides one of the best opportunities to examine the methodologies of those who employed it in their investigations. Consisting of a single string which could be divided at measured points by means of movable bridges, it was used to demonstrate theorems about the arithmetical relationships between pitched sounds in music. This book traces the history of the monochord and its multiple uses down to Ptolemy, bringing together all the relevant evidence in one comprehensive study. By comparing the monochord with a number of other ancient scientific instruments and their uses, David Creese shows how the investigation of music in ancient Greece not only shares in the patterns of demonstrative and argumentative instrument use common to other sciences, but also goes beyond them in offering the possibility of a rigorous empiricism unparalleled in Greek science.

DAVID CREESE is Assistant Professor of Greek and Latin Literature at the University of British Columbia.

## PREFACE

This book is about an instrument that shaped the way scientists thought about music in Greek antiquity. It is also about the way Greek science shaped the use of a musical instrument. With its single string, movable bridge and graduated rule, the monochord (*kanōn*) straddled the gap between notes and numbers, intervals and ratios, sense-perception and mathematical reason. By representing musical sounds as visible, measurable distances (lengths of string), and by representing numbers audibly to the musical ear, it offered a way to study music as an arithmetical science through the medium of geometry. As an audible extension of the lettered diagram of Greek mathematics, what it offered the harmonic scientist, most importantly, was a means of attempting to extend the irrefutability of mathematical argument into the auditory realm, even when whether or not it succeeded in doing so was controversial.

It gives me great pleasure to record my thanks to the many people who have helped me in the writing of this book. My greatest debt is to Andrew Barker, who supervised the doctoral thesis on which it is based, and whose continued interest, encouragement and critical engagement were immensely helpful not only during the initial research but also during the final revisions of the book, and at countless points in between. I also benefited greatly from the comments and advice of my doctoral examiners, Charles Burnett and Niall Livingstone, many of whose questions and ideas have caused me to rethink my interpretations of the ancient evidence and reshape my arguments about them in this book. G. E. R. Lloyd was especially generous in reading the entire manuscript twice in different versions and offering detailed and challenging suggestions for its improvement, particularly in the development of comparisons between harmonics and other ancient sciences. I am also grateful to Alan C. Bowen, Peter Merten, Nathan Sidoli and Malcolm

## PREFACE

Wilson for reading sections of the book in draft and for correcting some of my more egregious misunderstandings of astronomy and physics. For their invitations to present papers related to the research for this book, I should like to thank John Beatty, Sylvia Berryman, Robert Daum, Ingrid Holmberg, Donatella Restani and Gordon Shrimpton. Maya Yazigi answered my questions about the Arabic text of Diocles' *On Burning Mirrors*; Colin Gough helped me to understand the physics of sympathetic vibration; and Leonid Zhmud corresponded with me about Duris of Samos and the early history of the monochord. I have also benefited from discussions with Sylvia Berryman, Lisa Cooper, C. W. Marshall, Hallie Marshall, Francesco Pelosi, Massimo Raffa, Eleonora Rocconi and Robert B. Todd.

Final revisions to the manuscript were carried out during a period of research leave generously granted by the University of British Columbia, part of which was spent at the Scuola Normale Superiore in Pisa. I am especially grateful to Chiara Martinelli and Glenn Most for their invitation to spend what was a very productive time there, and also to Adrian Hasler for providing a similarly ideal (if very different) research environment during the previous summer. For their patience and assistance I thank Michael Sharp and Elizabeth Hanlon at Cambridge University Press, and for her care in copy-editing a demanding typescript I thank Linda Woodward, whose knowledge of the subject was as helpful as her attention to detail. I have received support of many kinds from my family, especially my parents, who read and commented on parts of the book, and above all my wife, Maggi, whose readings of many drafts saved me from errors too numerous to mention, and without whose constant interest, affection and assistance the book could not have been written at all.
